

## Optometry Services

### **Comprehensive eye examination:**

Periodic eye and vision examinations are an essential part of preventive health care. Many eye problems have no obvious signs or symptoms, so one might not know a problem exists. Early diagnosis can help prevent vision loss. Depending on each individual's signs and symptoms, along with our Optometrist's professional judgment, the tests will include refraction, eye movement and coordination assessment, ocular pressure check and eye health evaluation.

### **Myopia Clinic:**

In children with developmental / school myopia, progression inevitably increases the risk of pathological changes in the eye. The clinic offers Orthokeratology lenses or special spectacle glasses to control the increase in myopia and eye elongation.

### **Specialty Contact Lens Clinic:**

Provides optometric care for people with conditions such as keratoconus, pathological myopia (nearsightedness), ocular surface disease, irregular corneas after surgery, and scarred/ disfigured eyes. The clinic designs custom lenses, either corneal GP, Scleral lenses or Hybrids, for patients to address these conditions so they can see clearly and comfortably.

### **Low Vision Clinic:**

Conditions such as Glaucoma, Retinitis Pigmentosa, Age-Related Macular Degeneration, Diabetic Retinopathy, Cone-Rod dystrophies, Corneal dystrophies, Nystagmus, Albinism, etc. can cause irreversible visual impairment. The clinic provides assistive optical and non-optical aids to help with functional limitation and enhance residual vision.
